Project Requirements

Owners: Kai Cardona, Taylor Olinde, Charles Cusac, and Shannon Conway

1. User Story 1: The website should focus on a way to view cards in a collection setting with the option to switch between displaying the image of the cards and a text version that has the name of each card. Links for the purchase of cards is important, as well as a life counter so that you can play while browsing your cards with friends and rivals. I would also like to have features built in to assist with deckbuilding.

2. User Story 2: In my opinion, the product should have a focus on including other card games and features, such as a life counter, in order to include members of more communities and expand on the potential customer base. Other features that would be useful would be a way to display the cards in different ways and a feature that automatically suggests cards that you might like.

3. User Story 3: The most important feature of the product is by far a card collection service that allows for the viewing and browsing of ones cards online. Important features also pertain to things such as ease of access, easy search options, and help with deckbuilding and card browsing. Features that pertain to playing the game itself are not as important for the product.

4. User Story 4: A focus on display is important in order for the website to feel organic and easy to use. I think that including other card games besides Magic: The Gathering would also be a nice addition. A card/deck collection isn't overly important but I would like a section that recommends cards based on what you search for and what you've looked at.

5. User Story 5: The product must focus on a way to view my card collection online and other ways to improve on the decks and cards that I own. The overall display and search functions should look clean and feel good to use. Also, it would be best for the website to focus on Magic: The Gathering in order to implement better features without getting distracted by including other games.

6. User Story 6: The idea of a card and deck collection is a great feature that should be added. Links to purchase aren't necessary because there are other services that already do it quite well, but features that add to, focus on, and enhance deck building and card collections are necessary to the final product.

7. User Story 7: Must focus on showing collection and deckbuilding. Would like to see cards by picture or in text format and see cards often used with or similar to the current card. Could include price of cards with links to purchase them when viewing a specific card or deck. Should not include support for other trading card games and seeing statistics on deck or having life counter option is not necessary.

8. User Story 8: Must be able to view collection and decks with cards often associated with current card and include links to purchase the card with real-time updated price check. Would like to see statistics on decks and to view by card or text list. Can have support for other trading card games.

9. User Story 9: Have collection listed as option to switch between large card view and list text view. Must include ways of showing collection and decks. Must show similar or often played with cards when viewing cards. Would like links to purchase copies of cards from collection or when deckbuilding. Can include different trading card games other than Magic. Would like to see statistics on decks when viewing. Can include life counter option but not necessary to finished product.

10. User Story 10: Have a way to sort and view cards in collection via database. Give links to purchase copies of cards from collection or deckbuilding. This site should include other tcg not limited to Magic: the Gathering. When viewing cards a list or attachment can include other cards often played with or similar to the card being viewed.
